Mortgage bond futures

The mortgage bond futures offered for 2- and 5-year maturities are used as a complement to the cash bonds markets offering more liquidity and trading opportunities. The contracts have standardized expiration days, i.e., IMM days, and liquidity is concentrated to a limited number of contracts which benefits trading. The issuers for which futures contracts are currently listed is Swedbank Hypotek, Stadshypotek and Nordea Hypotek.

Facts about mortgage bond futures

<table>
<thead>
<tr>
<th>Contract type</th>
<th>Futures contract with a combination of daily cash settlement and delivery of underlying cash instrument at fixing</th>

Market model

Trades in futures will either take place on the regulated market of Nasdaq Stockholm AB (the Exchange) and reported as block trades or reached through bilateral negotiations between buyers and sellers and reported to NASDAQ Clearing (the Clearinghouse) for central counterparty clearing.

¹ As previously communicated by Nasdaq, the coupon interest of the contract base will be changed from 6% to 1% as of the quarterly listing procedure in February 2021.
The exchange has agreements with a number of market makers regarding the maintenance of a market with two-way prices aimed at ensuring ample liquidity in the contract. Market makers are expected to establish indicative two-way prices in the exchange’s trading system in accordance with standard market practices in the Swedish interest-rate market.

**Trade registration**

Trades can be registered via Nasdaq supplied front-ends Trading Workstation and Q-port or via FIX or OMnet API. For more information about technical protocols and Genium Inet Front-Ends please visit https://www.nasdaq.com/solutions.

**Contract base and deliverable instrument**

The contract base is a synthetic mortgage bond with a maturity of two or five years at expiration and an annual coupon of one percent. The futures contract offers a combination of daily cash settlement and delivery of underlying instrument at expiry. The deliverable instrument is a covered bond by the relevant issuer with a remaining maturity of two or five years at the expiration settlement day and will be settled with a DVP instruction in Euroclear Sweden. There will only be one Deliverable Instrument per Futures contract. The list with deliverable bonds are published via exchange notices and at https://www.nasdaq.com/solutions/fixed-income-derivatives-clearing.

When determining which instruments shall be the Deliverable Instrument for each Series the Clearinghouse will consider either expiration or duration, depending on the issuer, as well as the issued amount. The Clearinghouse may contact the Issuer in order to determine the Deliverable instrument but is not required to do so.

**Swedbank Hypotek and Nordea Hypotek** – expiration date of the Futures contracts is compared to that of the available bonds and the one(s) with expiration that deviate as little as possible from the contract base is chosen as Deliverable Instrument

**Stadshypotek** – duration of the Futures contracts is compared to that of the available bonds and the bond(s) that deviate as little as possible from the contract base is chosen as Deliverable Instrument

**Name standard**

Contracts are listed by the contract base short name followed by a letter designation for the delivery month and the number of the year in which the expiration month falls.

**Example of 5-Year STH future with expiration month in June 2017 (STH5YM7)**

On March 22 2017, 1500 June 5-year Stadshypotek bond futures representing a nominal value of SEK 1500 000 000 are bought at a transaction yield of 1.86. The contract expires on June 15 and changes in market value is settled daily against the Daily Fix. If the bought contracts are held until expiry the buyer will take delivery of 1500 000 000 of the deliverable bonds from the seller in exchange for payment based on the Expiration Day Fix³. Cash settlement and physical delivery of the underlying bond will take place on June 21 (IMM-day) in Euroclear Sweden.

---

² The example and calculations provided below are based on the contract base having a 1% coupon rate. For reference the calculations are repeated at the end of the document with the contract base having a 6% coupon rate.

³ Daily and Expiration Day Fix is the median value of the average bid and ask yields published by each respective market maker for each series in question
Example of cash settlement calculation on trade date 1% coupon rate

At the end of trade date March 22, 2017, the fix for STH5YM7 is determined to be 1.885 percent. The held position is marked-to-market based on the difference between the transaction price and the daily fixing value. The contract base for the STH5YM7 contract is a synthetic 5-year Stadshypotek bond which is deemed to have a maturity of five years calculated from the final settlement day of the contract, a coupon rate of 1% and 1 year (360 days) until next coupon.

Market value based on the transaction rate of 1.86 percent:

\[
\left( \frac{1}{1.86/100} \times \frac{\left( 1 + \frac{1.86}{100} \right)^5 - 1}{\left( 1 + \frac{1.86}{100} \right)^{\frac{360}{360}}} + 100 \right) \times \frac{150000000}{100} = 1,438,948,500.00
\]

Market value based on the current market rate 1.885 percent:

\[
\left( \frac{1}{1.885/100} \times \frac{\left( 1 + \frac{1.885}{100} \right)^5 - 1}{\left( 1 + \frac{1.885}{100} \right)^{\frac{360}{360}}} + 100 \right) \times \frac{150000000}{100} = 1,437,219,450.00
\]

Profit/loss for the position (buyer): -1,729,050.00 SEK.
The buyer of the contracts thus makes a loss since the fixing is higher than the agreed rate.

Valuation of mortgage bond futures

Every new trade that is registered for clearing will be valued independently of each other on trade date according to above example. When the new trades have been marked-to-market on trade date, they will be aggregated into a net position.
The new net position will on the following day be marked-to-market based on the current fix and previous fix.
Hence, a trade valuation will differ from a position valuation with respect to the following:

<table>
<thead>
<tr>
<th>Trade Valuation</th>
<th>Position Valuation</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>Trade price</td>
</tr>
<tr>
<td>R2</td>
<td>Previous fix</td>
</tr>
<tr>
<td>Nam</td>
<td>Current fix</td>
</tr>
<tr>
<td>Nam</td>
<td>Current fix</td>
</tr>
<tr>
<td>Nam</td>
<td>Aggregated position</td>
</tr>
</tbody>
</table>

The following formula is used to calculate the settlement amount for mark-to-market:

\[ B = \left( \frac{K}{R/100} \times \left( \frac{1 + \frac{R}{100}}{1 + \frac{R}{100}} \right)^{n-1} - 1 + IK \right) \times \left( \frac{1 + \frac{R2}{100}}{1 + \frac{R2}{100}} \right)^{d} \times \frac{Nam}{100} \]

- B Settlement Amount
- K Coupon
- R Trade price / previous fix
- R2 Current fix / final fix
- n Number of remaining Coupons
- d Number of days until next coupon
- IK Redemption price
- Nam Nominal Amount Single trade / aggregated position

**Yield conversion to price 1% coupon rate**

Bond futures market valuation is performed by converting the contracted rate quoted in yield to a price in money. The same is done for the end of day fixing value. The full price of the bond can be determined by using the following equation:

\[ P = \frac{C}{(1 + r)} + \frac{C}{(1 + r)^2} + \frac{C}{(1 + r)^3} + ... + \frac{C}{(1 + r)^n} + \frac{C + N}{(1 + r)^n} \]

This equation is also helpful in order to understand the implications should the daily fix, or trade price, be zero. Should “r” equal zero then the price is equal to the sum of nominal amount and coupons. I.e. a 2-year contract will have a price of 102 (1+101), a 5-year contract will have a price of 105 and a 10-year contract a price of 110.

The contract base for the STH5YM7 contract is a synthetic 5-year Stadshypotek bond which is deemed to have a maturity of five years calculated from the final settlement day of the contract and a coupon rate of 1%.

The price (P) of the bond in the above example can thus be calculated as:

\[ P = \frac{C}{(1 + r)} + \frac{C}{(1 + r)^2} + \frac{C}{(1 + r)^3} + \frac{C}{(1 + r)^4} + \frac{C + N}{(1 + r)^5} \]

C = the coupon rate in percent (1)
N = the nominal amount of the bond in percent (100)
Price calculation based on transaction yield 1.86 percent:

\[ P = \frac{1}{(1 + 0.0186)} + \frac{1}{(1 + 0.0186)^2} + \frac{1}{(1 + 0.0186)^3} + \frac{1}{(1 + 0.0186)^4} + \frac{1}{(1 + 0.0186)^5} \]

\[ P = 95,92990 \]

Price calculation based on fixing yield 1.885 percent

\[ P = \frac{1}{(1 + 0.01885)} + \frac{1}{(1 + 0.01885)^2} + \frac{1}{(1 + 0.01885)^3} + \frac{1}{(1 + 0.01885)^4} + \frac{1}{(1 + 0.01885)^5} \]

\[ P = 95,81463 \]

Profit and loss 1500 SGB2YM7 = -1 729 050 = 1500 000 000 \times \frac{(95,81463 - 95,92990)}{100}

**Example of cash settlement calculation on trade date 6% coupon rate**

Market value based on the transaction rate of 1.86 percent:

\[
\left( \frac{6 \times \frac{1.86}{100}}{1 + \frac{1.86}{100}} \right) \times \left( \frac{1 + \frac{1.86}{100} - 1}{1 + \frac{1.86}{100}^{(5-1)} + \frac{1.86}{360}} \right) \times \frac{1500 000 000}{100} = 1,793,899,050.00
\]

Market value based on the current market rate 1.885 percent:

\[
\left( \frac{6 \times \frac{1.885}{100}}{1 + \frac{1.885}{100}} \right) \times \left( \frac{1 + \frac{1.885}{100} - 1}{1 + \frac{1.885}{100}^{(5-1)} + \frac{1.885}{360}} \right) \times \frac{1500 000 000}{100} = 1,791,911,850.00
\]

Profit/loss for the position (buyer): -1,987,200.00 SEK.
The buyer of the contracts thus makes a loss since the fixing is higher than the agreed rate.

**Yield conversion to price 6% coupon rate**

Bond futures market valuation is performed by converting the contracted rate quoted in yield to a price in money. The same is done for the end of day fixing value. The full price of the bond can be determined by using the following equation:

\[ P = \frac{C}{(1 + r)} + \frac{C}{(1 + r)^2} + \frac{C}{(1 + r)^3} + \cdots + \frac{C}{(1 + r)^n} + \frac{C + N}{(1 + r)^n} \]
This equation is also helpful in order to understand the implications should the daily fix, or trade price, be zero. Should \( r \) equal zero then the price is equal to the sum of nominal amount and coupons. I.e. a 2-year contract will have a price of 112 (6+106), a 5-year contract will have a price of 130 and a 10-year contract a price of 160.

The contract base for the STH5YM7 contract is a synthetic 5-year Stadshypotek bond which is deemed to have a maturity of 5 years calculated from the final settlement day of the contract and a coupon rate of 6%.

The price \( P \) of the bond in the above example can thus be calculated as:

\[
P = \frac{C}{1 + r} + \frac{C}{(1 + r)^2} + \frac{C}{(1 + r)^3} + \frac{C}{(1 + r)^4} + \frac{C + N}{(1 + r)^5}
\]

\( C = \) the coupon rate in percent (6)
\( N = \) the nominal amount of the bond in percent (100)

Price calculation based on transaction yield 1,86 percent:

\[
P = \frac{6}{(1 + 0.0186)} + \frac{6}{(1 + 0.0186)^2} + \frac{6}{(1 + 0.0186)^3} + \frac{6}{(1 + 0.0186)^4} + \frac{106}{(1 + 0.0186)^5}
\]

\( P = 119,59327 \)

Price calculation based on fixing yield 1,885 percent

\[
P = \frac{6}{(1 + 0.01885)} + \frac{6}{(1 + 0.01885)^2} + \frac{6}{(1 + 0.01885)^3} + \frac{6}{(1 + 0.01885)^4} + \frac{106}{(1 + 0.01885)^5}
\]

\( P = 119,46079 \)

\textit{Profit and loss} 1500 SGB2YM7 = \( -1,987,200 = 1500,000,000 \times \frac{(119,46079 - 119,59327)}{100} \)
