CO2 Removal Certificate (CORC) Index
Family– Re-balancing of the Composition of the CORCX Index

From January 2023, the minimum threshold for carbon removal durability of the Puro Standard CORC will be 100 years. In accordance with the CORCX Methodology, Puro.earth has notified Nasdaq Copenhagen that the CORC Bio-based Construction Materials (CORCWOOD) method is no longer active under the Puro Standard. This means that the CORCWOOD will no longer be part of the CORCX and no individual Index Value will be calculated for this method.

A re-balancing of the index weightings has therefore been calculated. The following new composition will take effect from January 1, 2023 and will be used when the CORCX Index Values are calculated and distributed, beginning of February 2023:

**CORCX weights**

<table>
<thead>
<tr>
<th>Method</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>CORC Biochar</td>
<td>100.00%</td>
</tr>
</tbody>
</table>

The new weights are based on the total volumes from March 1st to August 31st 2022. In the absence of CORCWOOD, the only other method that meets the minimum thresholds set out in the Methodology during the relevant period is CORC Biochar.

The weightings will be next reviewed in March 2023, in line with the semi-annual review cycle as set out in the Methodology.
