

INET Nordic Dedicated OUCH Gateway Service

Take advantage of accessing the Nasdaq Nordic marketplaces via a dedicated gateway. Nasdaq provides firms with the unique opportunity to access liquidity of the Nordic marketplaces via a dedicated gateway that is not shared with other firms and therefore avoid the potential impact of other firms trading activity. In addition to have been offering this service for the Nordic Derivatives market, we now are able to offer this service also for the Nordic Cash Equity market.

About the Offering

With the efficiency and high level of performance for OUCH customers this unique offering provides a dedicated environment for customers' logical ports with deterministic latency.

With a Dedicated OUCH gateway, firms can develop a tailored trading solution for their firm by utilizing OUCH ports as they see fit across a server. Controlling ports and message traffic gives firms the ability to shift connectivity to optimize their trading strategies.

Firms can migrate existing OUCH ports and/or order new OUCH ports to subscribe to this service; however, a migration of an existing port will require a new port and IP address. For each dedicated gateway you have the possibility to have up to 30 OUCH ports.

Fail-over redundancy

- For intra-site fail-over: customers can rely on ordinary shared gateways or request an additional dedicated gateway on the primary site
- For inter-site fail-over: customers can rely on existing shared gateways on the secondary site

Existing co-location customers may place orders using the CoLo and Connectivity Console. Please refer to the Nasdaq Nordic Technical Price List for install and monthly fee rates.
